

CUTTING GUIDE

Abstract of the Disclosure

A cutting guide for effecting straight accurate cuts along a workpiece includes a clamp, a saw guide pivotally coupled to the clamp and having a guiding edge for bearing support for a portion of the saw so as to guide the saw during the cutting operation of the workpiece, and a cutting
5 template. The cutting template is cuttable so as to produce a template cutting edge on a first template portion and a second discard portion. The template cutting edge identifies the position of the guiding edge relative to a cut line for a specific saw and for a specific angled cut. The cutting template may be used to cut subsequent workpieces having the same cut configuration and using the
10 same saw. A user may have a plurality of cutting templates, each having a different first template portion configuration.
